Planning, Less Time Chasing Updates

“We reduced our visibility of demand from the next 18 months to the next six months.”

RAUL GUTIERREZ

STRATEGIC PROCUREMENT MANAGER AT TIME MANUFACTURING

When Time Manufacturing struggled to manage ten thousand purchased parts through email and spreadsheets, the procurement team could not trust supplier responses on price, quantity, or due date. MRP outputs were unreliable, production planning was reactive, and buyers spent unrelated time chasing confirmations. The company adopted SourceDay’s real-time purchase order collaboration, integrated with its Epicor ERP, to eliminate manual follow-ups, standardize confirmations, and give buyers confidence in the data driving production plans.

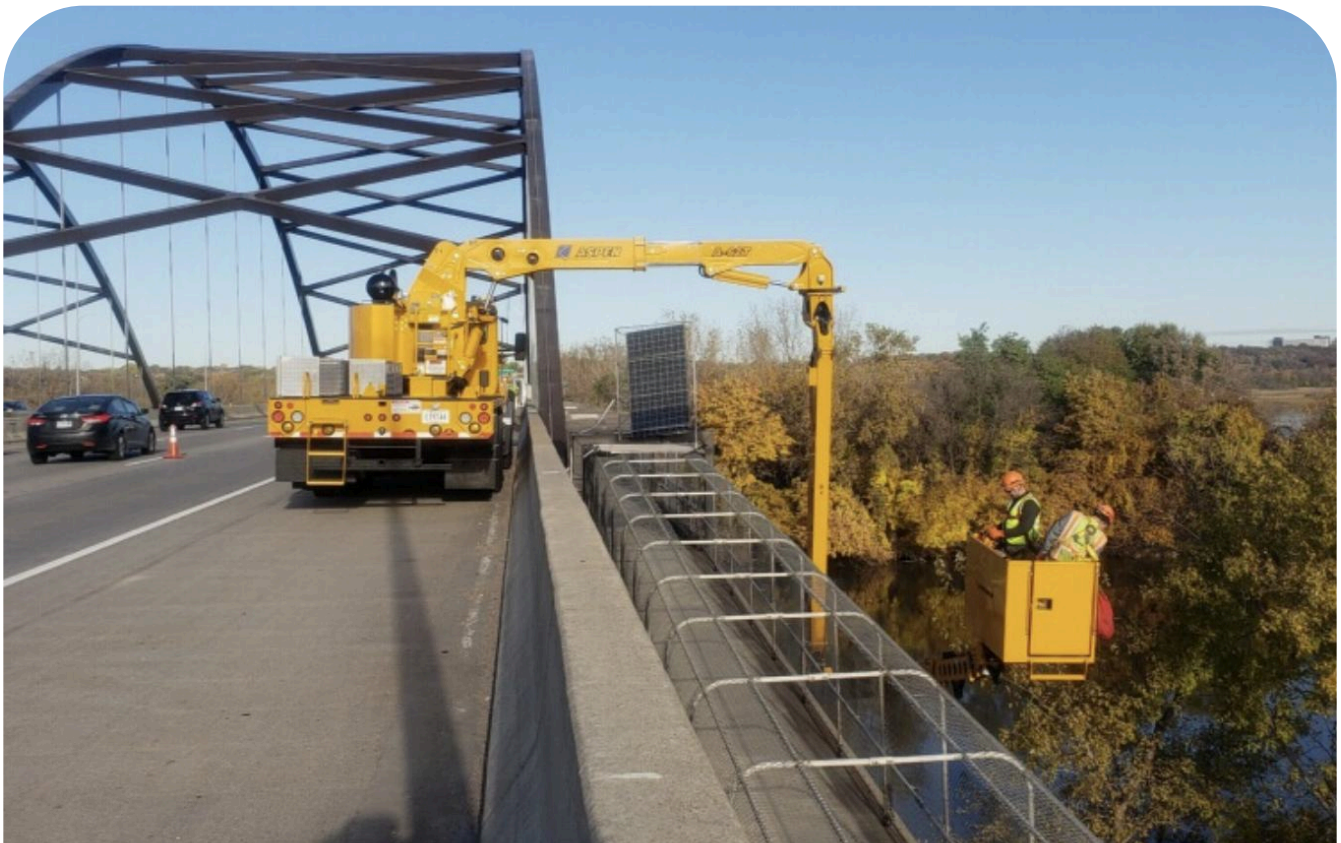

SourceDay

The Customer

Time Manufacturing produces aerial lifts and bucket trucks used by utilities and service providers. Managing a complex direct materials supply base with 5,000–10,000 purchased parts, the company faced challenges getting accurate, timely confirmations from suppliers so that MRP could drive production plans reliably.

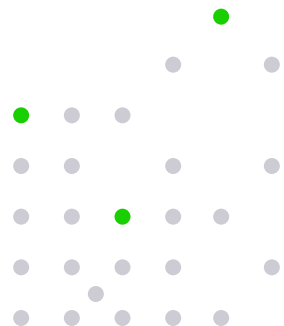

The Challenge

Before SourceDay, buyers ran MRP twice a week and then had to manually email POs to suppliers and wait for confirmations on price, quantity, and due dates – often without knowing if suppliers ever received the emails. “We had problems where that answer back from the suppliers didn’t arrive... so we had to spend a lot of time chasing suppliers just to make sure that the information got to them,” said Raul Gutierrez, Strategic Procurement Manager at Time Manufacturing.

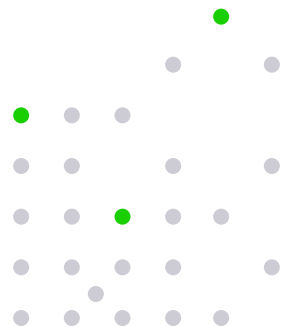

This uncertainty created long follow-up cycles and consumed procurement time, leaving little left for strategic planning. When confirmations did not arrive or arrived late, buyers could not trust the ERP data used for scheduling, leading to inaccurate plans and a production backlog that extended 18 months.

Because of inconsistent supplier responses and fluctuating pricing, three-way matches were difficult.

The Challenge (Continued)

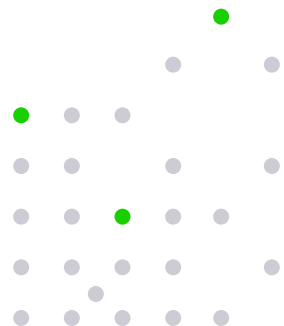

This delayed payments and created dissatisfaction among suppliers. Production schedules were reactive, and buyers had limited insight into risk or changes happening in the crucial 1–4 week window before material was needed.

The Solution

With SourceDay, buyers stopped chasing acknowledgments and began working from trusted, up-to-date order data:

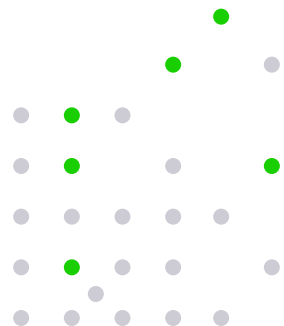

- **PO confirmations entered the ERP in minutes**, eliminating email uncertainty and ensuring price, quantity, and due dates were correct soon after POs were issued.
- **Buyers no longer had to chase suppliers for response.** Instead of waiting days to know if a PO was accepted or if changes were needed, suppliers confirmed directly through SourceDay. “Within the next few minutes, SourceDay takes that information and sends it to the supplier.”
- **Buyers regained time for planning**, using the hours saved from not chasing confirmations to review MRP results, adjust demand, and align purchases with production needs.
- **Supplier participation grew**, with about 80% of suppliers active in SourceDay at the time of the webinar and plans to increase that percentage because there is no cost to suppliers and the platform improves their ability to communicate with Time Manufacturing.

The Results

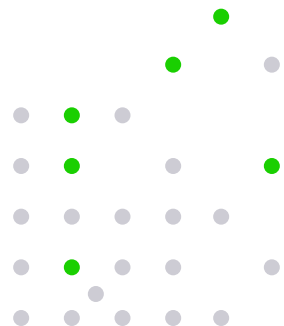

With SourceDay in place, Time Manufacturing shifted from manual follow-ups and uncertainty to reliable supplier confirmation and improved production attainment:

- **Production attainment improved from ~85% to 98%.** With reliable supplier confirmations and accurate ERP data, Time started hitting its daily production targets more consistently and eliminate weekend work. “We set a goal to produce a specific number of machines each day... we started maybe at 85% and in the last six months we are up to 98% production attainment.”
- **Visibility into supply improved.** Alerts and shipment visibility tools gave procurement early insight into upcoming deliveries, allowing adjustments to production plans before disruptions occurred.
- **Reduced planning horizon risk 67%.** With up-to-date confirmations, buyers reduced the effective planning uncertainty from an 18-month backlog to a horizon they could control and trust. “We reduced our visibility of demand from the next 18 months to the next six months.” shared Gutierrez.

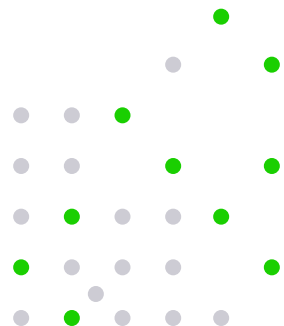

The Results (Continued)

- **Suppliers became more engaged.** About 80% of direct suppliers were active in SourceDay, checking orders and performance indicators regularly. Some suppliers even reached out when receiving delays in Time's warehouse system affected their own delivery performance.
- **ERP data trust improved.** Price, quantity, and due date confirmations flowed into Epicor reliably, removing guesswork from MRP and enabling planners to base decisions on current information.

The Takeaway

By replacing manual email and spreadsheet workflows with real-time PO collaboration, Time Manufacturing gained accurate supplier confirmation data, improved MRP trust, and significantly increased production attainment. Procurement teams reallocated time from chasing updates to planning effectively, and supplier engagement increased without added cost to suppliers.

The #1 Supplier Portal Trusted by Leading ERPs

SourceDay is an AI-driven supplier portal purpose-built to help executives eliminate risk and inefficiency from purchase order lifecycle management. The platform uses patent-pending artificial intelligence and machine learning to deliver real-time visibility, predictive risk detection, and automated workflows—empowering leaders to drive supply reliability and efficient growth. SourceDay connects seamlessly with any ERP, centralizing purchase order data and automating manual tasks to improve accuracy and reduce errors. Executives benefit from measurable improvements in on-time delivery, buffer stock, invoice processing, and supplier reliability. The platform enables supply chain, operations, and finance leaders to reduce costs, protect revenue, and scale their business with resilience to supply chain disruption.
